

SIDE AND SILL CHANNELS

v 1.0 | 2 August 2022

Accessory for Nano Box and Pocket shades

Side Channel Features

- Side channels provide light blocking and privacy along the sides of a window by forming a channel for the fabric to travel within. The Side Channel is usable on shades mounted between the window jambs, surface mounted, and can be used with pocketed shades providing there is structure for the channels to mount to.

Side Channel low profile

Sill Channel Features

- The Sill Channel works with our side channels and provides light blocking and privacy along the bottom of a window. The Sill Channel mounts directly to the window sill and the 2" lip can be used to mitigate an uneven reveal when the window sill is out of level.
